

Using Insomnia

Insomnia is a nice and light REST client which lets you communicate with APIs. It supports environment variables which makes it perfect for developing for both development and production.

Downloads

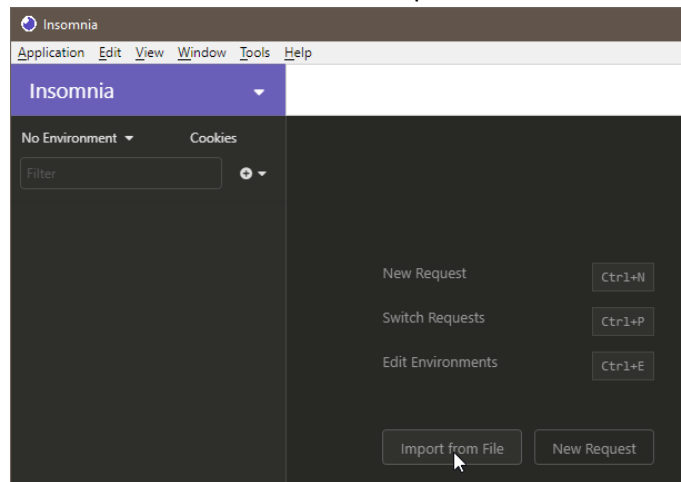

You can download insomnia here: <https://insomnia.rest/download/>

List of Requests not requiring authentication

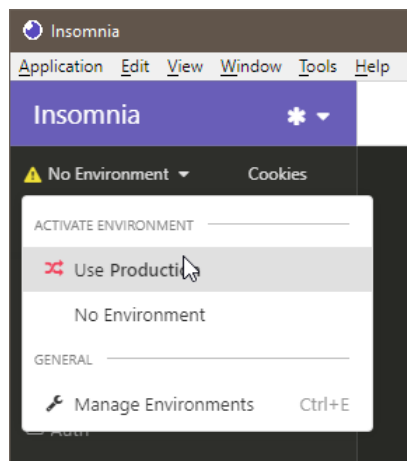

- Auth:
 - Login
 - Register
- News Feed:
 - Get News
- Currency:
 - Get Currencies
 - Get Bitcoin
 - Get Litecoin

Environments

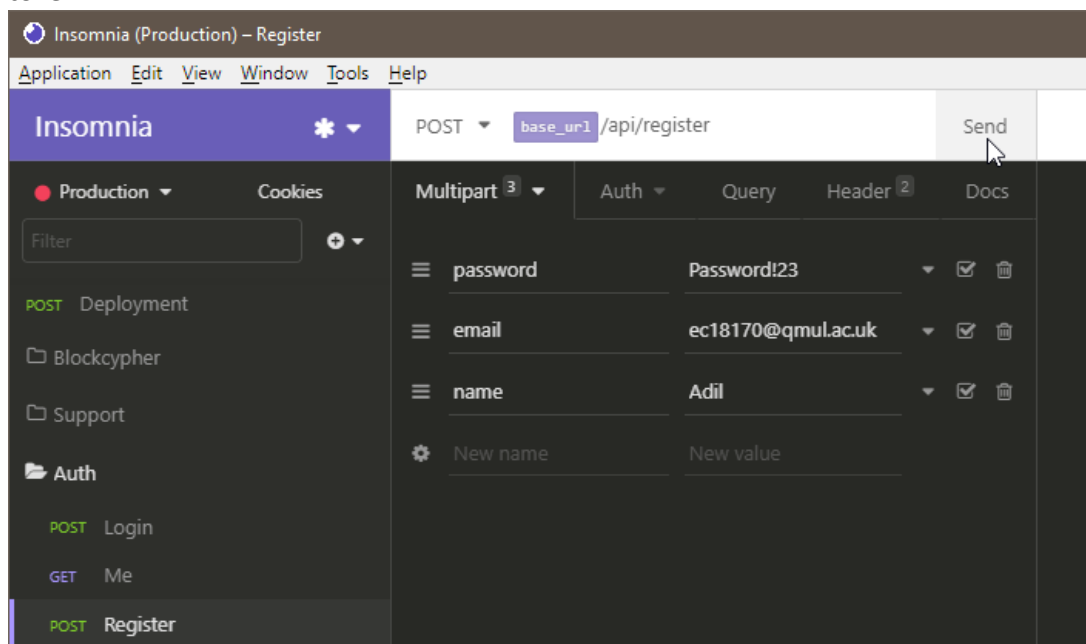

1. Click on the Import File button and select the workspace file.

2. Switch to the production environment.

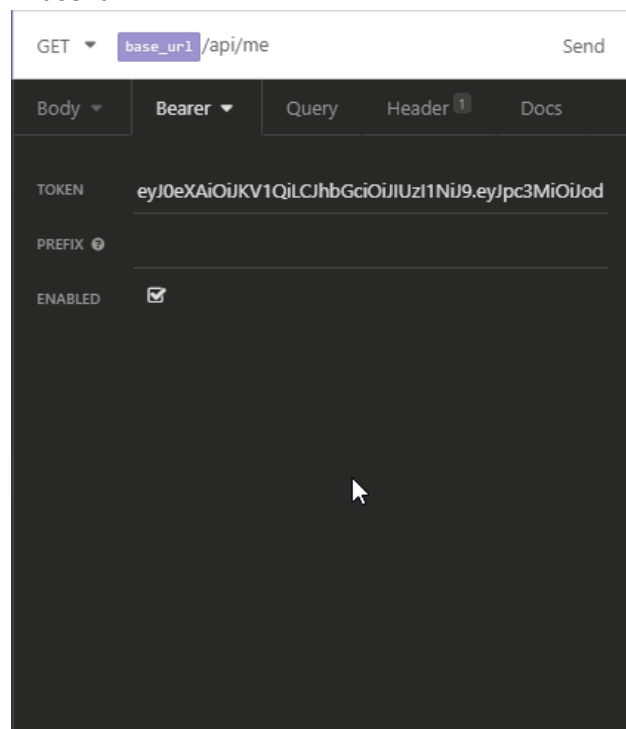

- Click on the Auth Folder and click on the Register request. Create an account and **copy the token**.

The token is used to authenticate the user with the API. Most requests require the use of the token. The token is passed in the header of the request.

To pass a token to a request, you click on Auth, select Bearer Token and then paste the token into the text box.

- To get information about your user, click on the Me request and paste your token into the auth panel and then hit send.
